TEBD (time evolving block decimation) algorithm

Goal: time evolution

only acts on sites i, i+1

Consider nearest-neighbor Hamiltonian

 $H = \sum_{i} h_{i,i+1} = \sum_{i \text{ even}} h_{i,i+1} + \sum_{i \text{ odd}} h_{i,i+1}$ $- W^{e} + H^{\circ}$

Suzuki Trotter decomposition:

loop over many small time steps δ until we reach +

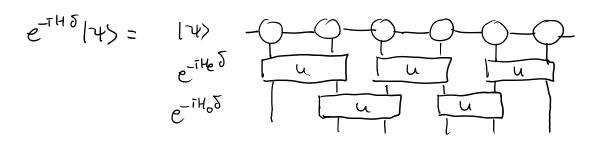

or second order

$$e^{-iH\delta} = e^{-iHe\delta} e^{-iHe\delta} + o(\delta^2)$$

 $e^{-iH\delta} = e^{-iHe\delta} e^{-iHe\delta} e^{-iHe\delta} + o(\delta^3)$

(higher order formulas available)

with exact exponentials

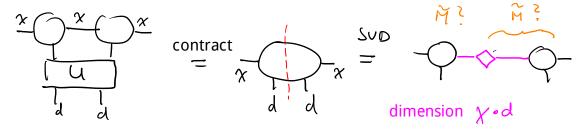

"Brick wall"

alternative: left-right sweep "staircase" for imaginary time evolution

How to get back into MPS form?

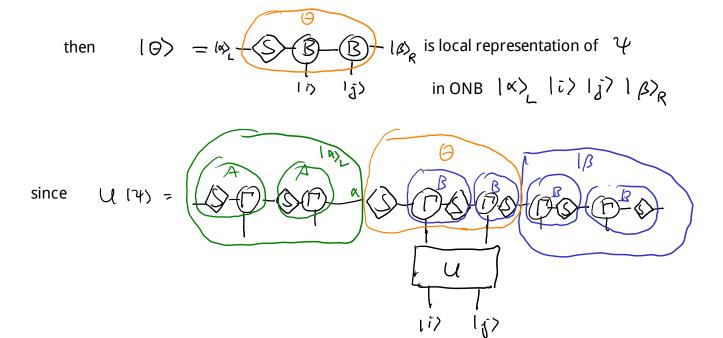

consider applying a single 2-site gate

Problem: bond dimension at center bond grows, we need to truncate

To get a globally optimal truncation, we need an ONB!

Trick: save S and right-canonical B on each site (also good for local expectation values)

Thus, the *correct* TEBD update is:

$$U(0) = \frac{3}{4} = \frac{3}{4}$$

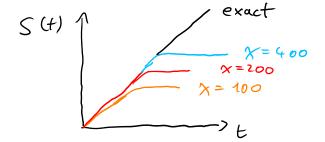

left Schmidt values don't change for local unitary U within one side but if truncation becomes too large, Schmidt values are no longer correct!

Note: we can trivially apply the U on all odd (even) sites in parallel

Note: the very same update scheme also works with infinite MPS, see below

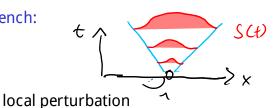

- Sources of errors: Trotter error => choose small time step
 - truncation error => allow to increase bond dimension over time

for a global quench: typically $S(t) \sim t$ so we would need $\chi(t) \sim e^t + U$

=> we need to stop time evolution when truncation errors become too large!

for local quench:

light-cone (Lieb Robinson bounds)

often tractable up to t= 20... 50 e.g. for calculations of spectral function

$$\langle \dot{X}(t) \dot{Y} \rangle = \langle Y_0 | e^{iE_{ot}} \hat{X} e^{iHt} Y | Y_0 \rangle$$

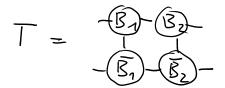

Infinite MPS / UMPS (Uniform MPS)

H is translation invariant, but we only need local updates so we can directly work in the thermodynamic limit $N \to \infty$

Instead of having different tensors on each site, consider a unit cell of length L, e.g. L=2

$$|\mathcal{A}\rangle = \sum_{i=1}^{n} \frac{\mathbb{B}^{2}}{|\tilde{\iota}_{i}\rangle} \frac{\mathbb{B}^$$

left and right infinite parts in overlaps / expectation values collapse to dominant eigenvectors of the transfer matrix

local updates of the tensors within the unit cell effectively act in parallel on all unit cells

Strictly, the local truncation is not globally optimal anymore

-> one can do mathematically rigurous time dependent variational principle (TDVP) in the tangent space of MPS

see Vanderstaten et al. arXiv:1810.07006

Matrix Product Operator (MPO)

= generalization of MPS to operators

conventient for Hamiltonians beyond nearest neighbors

$$H = \begin{cases} \langle i_1 | \langle i_2 | \rangle \rangle \rangle \langle i_1 \rangle \rangle \langle i_2 \rangle \rangle \langle i_3 \rangle \rangle \langle i_4 \rangle \langle i_5 \rangle \rangle \langle i_6 \rangle \rangle \langle i_6 \rangle \langle i_6$$

translation invariant Hamiltonian: same W everywhere

Examples

general: upper-triangular block structure

Pheral: upper-triangular block structure

$$\omega = \begin{pmatrix}
1 & C_h & P_h \\
0 & A & B
\end{pmatrix}$$

$$\Delta = \begin{cases}
D = \text{onsite term} \\
C B = \text{nearest-neighbor torm} \\
A = \text{long-range structure}$$

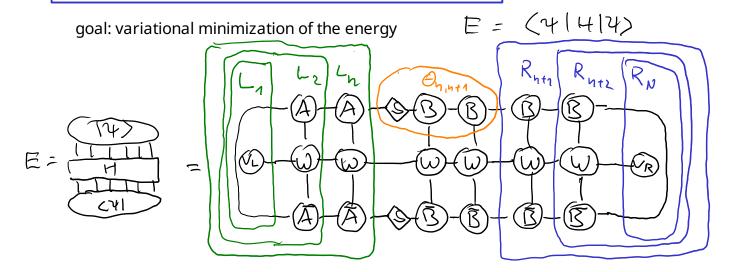

$$A = \begin{cases}
D_h + \sum_{h} C_h A_h B_h +$$

one can formalize construction of W to auto-generate MPOs for many Hamiltonians

note: W not diagonalizeable! Jordan structure
$$H = \begin{pmatrix} 1 & \varepsilon \\ 1 \end{pmatrix} \implies \begin{pmatrix} 1 & \varepsilon \\ 1 \end{pmatrix} \begin{pmatrix} 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 0 \\ 1 \end{pmatrix} + & \varepsilon \begin{pmatrix} 1 \\ 0 \end{pmatrix} \qquad \text{applying transfer matrix}$$

$$\begin{pmatrix} 1 & \varepsilon \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \begin{pmatrix} 1 \\ 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 0 \end{pmatrix} = \begin{pmatrix} 1 \\ 0 \end{pmatrix} \end{pmatrix} \begin{pmatrix} 1 \\$$

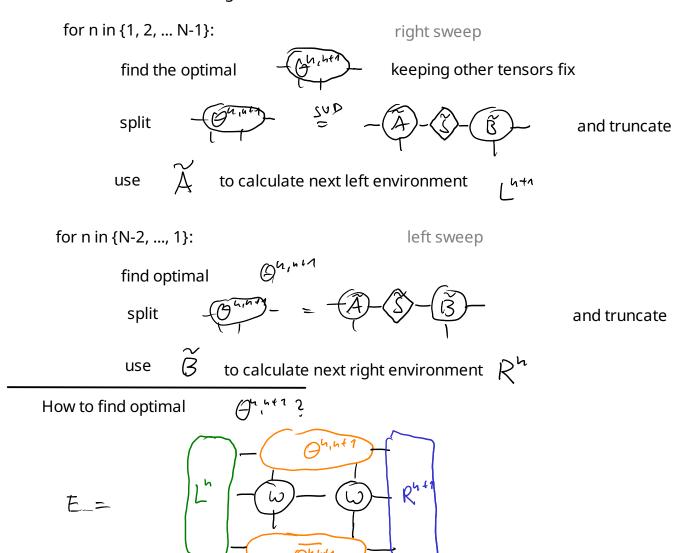

Density Matrix Renormalization Group (DMRG) algorithm

recursively define left/right environments L/R which contain only left/right-canonical MPS tensors (and MPO)

Finite DMRG: sweep algorithm

Start with an MPS in right canonical form

This is the Hamiltonian projected into the basis

This is an orthonormal basis!

Hence, the optimal

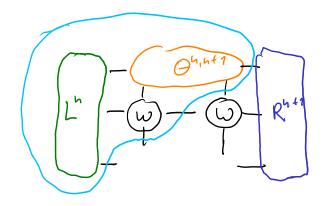

is simply given by diagonalizing

viewed as a matrix acting on the top indices

The ground state of

can be found with Lanczos algorithm (or similar)

Note: contraction order matters!

Infinite DMRG

consider a system which is translation invariant with unit cells with N sites

here: N=2

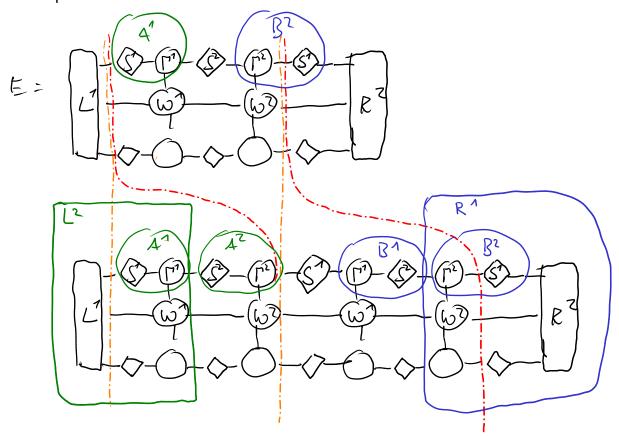

Start with a small system of just one unit cell

sweep left-right left in a single unit cell (as in finite DMRG) but include the bond between unit cells (which is trivial for finite DMRG)

During each sweep, grow the left/right environets by one unit cell, assuming translation invariance

Repeat until actual translation invariance is reached

Example: N=2

Note: total energy increases by energy density!

towards 2D: DMRG on a cylinder

MPS = 1D ansatz, but: MPO allows long-range hopping

idea: map 2D system to a 1D chain

MPS "snake"

pull on MPS ends

long range hopping!

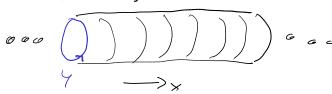

price: area law predicts

λ > exp(const · Ly)

 L_{γ} needs to be small, but L_{χ} can be big need to study scaling/dependence on \angle ____, often severe finite-size effects!

periodic boundary conditions in y-direction often reduce finite-width effect

infinite, narrow cylinder

allowed momenta in Brilluioun zone: Ly cuts

can shift cuts by

"threading flux through the cylinder"

= particles hopping around the cylinder pick up a phase.
